WELCOME

Prehabilitation and optimization are crucial strategies for enhancing patient health before surgery, thereby reducing the risk of postoperative complications. The presurgical period represents a window of opportunity to boost and optimize the health of an individual, providing a compensatory buffer for the imminent reduction in physiological reserve post-surgery.

Prehabilitation is a proactive approach that focuses on improving patients' physical and psychological resilience through interventions such as exercise, nutrition, and psychological preparation. Optimization centers on improving patients' medical conditions prior to surgery such as managing comorbidities, adjusting medications, and conducting health screenings. Both strategies are vital for expediting recovery, improving patient experiences and outcomes, and reducing healthcare system costs.

Surgical Patient Optimization Collaborative

Following the success of the 2015-16 Enhanced Recovery After Surgery (ERAS) Collaborative, the Surgical Patient Optimization Collaborative (SPOC) launched in 2019 with 14 sites and expanded with another 13 sites in 2022, to include a total of 27 sites. The collaboratives provided system change strategies, funding support, and shared learning to interdisciplinary teams. Through SPOC 1.0 and 2.0, prehabilitation programs have been established in more than 50% of hospitals performing surgery in BC, demonstrating the benefits of prehabilitation to surgical patients, providers, and the healthcare system within the BC surgical landscape.

The Toolkit

This toolkit was originally created in 2019 by the BC Surgical Optimization Working Group and vetted by 15 provincial sites involved in the Surgical Patient Optimization Collaborative (SPOC). Through 2024, the BC Prehabilitation Working Group reviewed and updated the toolkit, adding clinical context, actionable recommendations and screening tool recommendations based on current evidence-based guidelines.

This updated toolkit reflects valuable feedback from clinicians within the collaborative and insights from field experts, aimed at enhancing the usability of clinical component pathways. The revisions focus on making the pathways more actionable and practical for providers, while also adding new components that address emerging needs and best practices identified through ongoing engagement around prehabilitation.

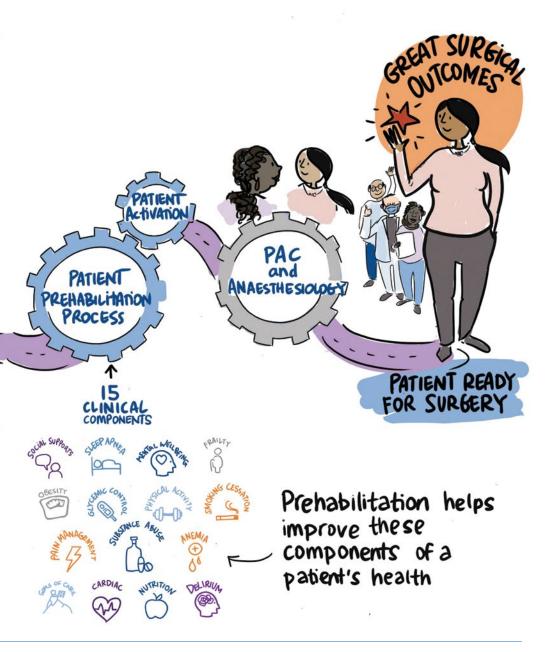

Scope

This toolkit includes clinical context for each clinical component and actionable recommendations for prehabilitation and optimization that may prove useful for healthcare providers looking to prehabilitate patients before surgery. This toolkit is not meant to dictate the practice of clinicians, rather to provide options that are available to both providers and patients throughout British Columbia. Clinicians are encouraged to use the toolkit at their own discretion based on the best interest of the patient.

PATIENT SURGICAL PREHABILITATION JOURNEY

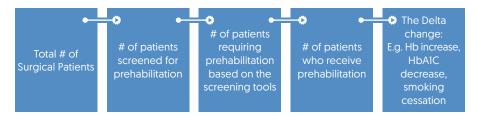

Aim: To improve patients' surgical outcomes by optimizing their mental and physical health before surgery.

Prehabilitation Performance Indicators

The following measures can be used as indicators to alert a team of any improvement that may be needed in the process of prehabilitation.

Postoperative patient outcomes should be recorded when optimizing patients for surgery (Appendix A)

Family and Caregiver Partners

Patient partners such as family members or other caregivers should be included as part of the prehabilitation team. To effectively involve patient partners in the prehabilitation process, the language, culture, and health literacy of both the patient and their partners should be considered.

The desired outcomes of both the patient and the patient partner should be considered when making decisions about surgery. This includes, but is not limited to, how much they would like to know about the process, what to expect from surgery, and what they expect their condition to be like after surgery.

The patient passport can be shared with the patient partner to facilitate their involvement in the prehabilitation process.

Adapted from Agency for Clinical Innovation | The Perioperative Toolkit

Implementing the Toolkit

For best chances of success in implementing the changes in this toolkit there must be appropriate planning of objectives, team member roles, and milestones. Communication with all relevant parties about the plan and the reason for implementing the toolkit will also increase the chances of success with patient prehabilitation. Finally, assessment of the process through objective and subjective measures allows for improvement of the process and can help lead to lasting change. Refer to the PCAN Surgical Patient Prehabilitation Implementation Toolkit for implementation guidance.

Adapted from Agency for Clinical Innovation | The Perioperative Toolkit

Revisions to the Toolkit

This toolkit is a collection of the best practices and knowledge available at the time of development. Any feedback can be directed to the Specialist Services Committee, sscbc@doctorsofbc.ca and appropriate changes will be made to the best ability of the development team.

KEY DEFINITIONS

Prehabilitation

Improving patients' physical and psychological conditions before surgery.

Optimization

Improving patients' medical conditions before surgery

Clinical Components

The aspects of a patient's health that can affect surgical outcomes.

Patient Activation

A patient's understanding, ability and willingness to manage and be involved in their own health and healthcare.

Screening Tool

Assessment of a surgical patient to determine whether or not prehabilitation is needed for each clinical component.

Prehabilitation and Optimization Recommendations

Actionable items that health care providers can use to prehabilitate and optimize patients.

Measurement

A measure of whether the patients selected for intervention were successfully prehabilitated.

ACKNOWLEDGMENTS

The BC Surgical Prehabilitation Toolkit was first developed by the Specialist Services Committee of Doctors of BC in 2019 and updated in 2024 with the support and expertise of all members listed below.

Over countless hours, the following individuals came together as working groups and a faculty of experts to create and refine the contents of this toolkit. We thank them for their contributions to BC healthcare.

CLINICAL COMPONENTS

CLINICAL COMPONENTS

The following pages provide the clinical context, screening tools, prehabilitation and optimization algorithms and actionable recommendations for each clinical component identified as a modifiable prehabilitation or optimization factor leading up to surgery.

The following information is included for each component:

- 1. Introduction providing the perioperative risks and impacts of prehabilitation and optimization for the component
- 2. Screening tool recommendation based on current evidence-based guidelines and validated risk scores where possible
- 3. Visual algorithm outlining potential workflow for assessing the clinical component and actional prehabilitation and optimization goals
- 4. Detailed information for each step in the visual algorithm

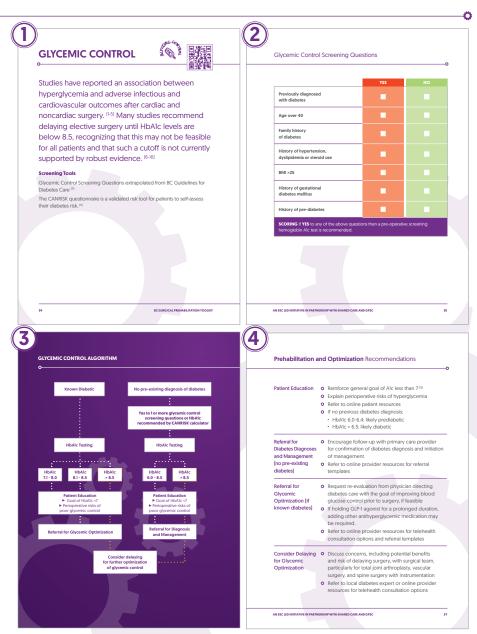

References for each section can be found at the end of the toolkit

Online resources referred to throughout the toolkit can be accessed on the

SSC website via the QR code.

Sample Clinical Component

ANEMIA

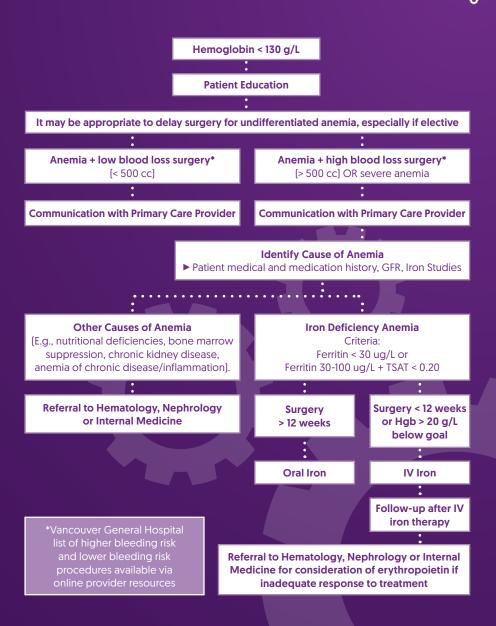

Preoperative anemia is common, especially in orthopedic, gynecologic, and colorectal surgical patients. ^[1,2] "The presence of preoperative anemia, even if mild, has been associated with increased risk of red blood cell (RBC) transfusion and increased morbidity and mortality after surgery. In addition, transfusion of RBCs has been consistently associated with worsened clinical outcomes". ^[3]

Screening Tools

Preoperative hemoglobin (Hgb) is recommended for screening based on patient co-morbidities and surgical invasiveness, as per site specific protocols. ^[3] If a patient is found to be anemic, basic screening for iron deficiency anemia as well as other causes (e.g., chronic kidney disease) is recommended.

Patient Education

- Communicate importance of optimizing hemoglobin before surgery to decrease perioperative risks
- Refer to online patient resources

Consider Delaying Surgery

- For cases of anemia with an unclear cause or iron deficiency anemia that is not related to the reason for surgery, consider postponing elective surgery to allow time for further investigation and treatment of the anemia to support better surgical outcomes and reduce potential complications. Suggest communication with surgical team.
- Patients undergoing high blood loss surgeries who would decline transfusion require special consideration. Consider multidisciplinary discussion and delaying surgery until hemoglobin goal is reached.

Communication with Primary Care Provider

and does not meet the criteria for perioperative optimization, it is important to inform the patient and request their primary care provider investigate and treat the underlying cause of the anemia. This is particularly crucial for patients with unexplained iron deficiency anemia, as they may need further evaluation to rule out serious conditions like gastrointestinal cancers.

Identify Cause of Anemia

- Population for optimization: surgeries with expected blood loss ≥ 500 mL or patients with severe anemia
- Example high blood loss surgeries include: redo/bilateral joints, multilevel spine, open gynecology, open bowel resection/general surgery, major urology cases, all cardiac, open thoracics, radical prostatectomies *full list of high and low blood loss surgeries for Vancouver General Hospital available via online provider resources
- Recommend performing basic screening to identify possible underlying causes of anemia. This should include taking a detailed bleeding history, reviewing the patient's medication history, and testing (e.g., iron studies, renal function)

Treat Iron Deficiency Anemia

- Criteria: Ferritin < 30 ng/L or Ferritin 30-100 ng/L and transferrin saturation < 0.20
- If surgery > 12 weeks away: oral iron (e.g., ferrous fumarate 300 mg PO every other night with 600-1200 mg vitamin C (4)); recheck Hgb after one month
- If surgery < 12 weeks away: IV iron dose can be based on the Ganzoni formula or standardized dosing (e.g., iron isomaltoside 1000 mg x 1 dose or iron sucrose 300 mg x 3 doses)

Follow-up After IV Iron Therapy

- IV iron takes 10-14 days for full effect, expect increase of up to 10 g/L/week
- Follow-up bloodwork should be arranged for 10-14 days post iron infusion and flagged for anesthesia review
- Ensure CBC is re-done within 30 days of surgical procedure
- After administering iron supplementation, the goal is to treat anemia so that hemoglobin levels reach above 130 g/L. If this target is not met before the scheduled surgery, clinical judgment should be used to decide whether to delay the surgery until the goal is achieved
- May recommend postoperative oral iron for patients having major surgery as it has been shown to speed recovery

Referral to Hematology, Nephrology, or Internal Medicine

If there are other potential causes of anemia besides iron deficiency (e.g., nutritional deficiencies, bone marrow suppression, chronic kidney disease, anemia of chronic disease/ inflammation), or if the patient shows an inadequate response to iron treatment, consider referring the patient to a subspecialist

CARDIAC

In patients hospitalized for at least one night after non-cardiac surgery, the overall 30-day mortality rate is 1.8% with urgent/emergent surgery being associated with at least double the risk of elective surgery. [1]

Many of these deaths are linked to cardiac complications. ^[1] Myocardial Injury after Noncardiac Surgery [MINS], indicated by troponin levels exceeding the 99th percentile due to myocardial ischemia without ischemic features, occurs in 12%-24% of cases. ^[2] MINS is associated with a postoperative 30-day mortality rate of 9.8%, compared to 1% for those without it, and increases the risk of major vascular complications such as myocardial infarction and stroke. ^[3,4,5]

Screening Tools

The Revised Cardiac Risk Index (RCRI) includes six factors, each worth 1 point. $^{(6)}$ A review of 792,740 patients showed that the RCRI has moderate ability to predict major perioperative cardiac complications. $^{(7)}$ For patients aged 65 or older, those aged 45-64 with significant cardiovascular disease, or those with an RCRI score \geq 1, measure NT-proBNP or BNP before noncardiac surgery to improve risk assessment. $^{(8)}$

RCRI SCREENING			YES	NO	
History of ischemic heart disease					
2. History of congestive heart failure					
3. History of cerebrovascular disease					
4. Use of insulin therapy for diabetes					
5. Preoperative serum creatinine > 177 µmol/L (>2.0 mg/dL)					
6. High-risk surgery					
SCORING Add 1 point for every YES					
Total RCRI Points	Risk Estimate %	95% CI for th	e Risk Estin	nate	
0	3.9	2.8%-5.4%			
1	6.0	4.9%-7.4%			
2	10.1	8.1%-12.6%			
≥3	15.0	11.1%-20.0%			

Total RCRI Score and corresponding risk of myocardial infarction, cardiac arrest, or death at 30 days after noncardiac surgery.

Ö

Patients undergoing non-cardiac surgery requiring overnight admission

Assessment of Preoperative Risk Using RCRI

•

If RCRI ≥ 1, patients' age is ≥ 65 yrs, or age is 45-64 yrs with significant cardiovascular disease

► Order NT - proBNP/BNP

 $\overline{\cdot}$

NT-proBNP ≥ 200 ng/L or BNP ≥ 93 mg/L

?

Referral for Anesthesia Consult

► Preoperative ECG

► Communicate risk of major adverse cardiac event to patient

Postoperative Monitoring

- ► Measure Troponin daily x 48 72 hrs
 - ► Obtain EKG and troponin in PACU
- ► Consider in-hospital shared-care management

:

Communicate with Primary Care Provider for Outpatient Follow-up

Order NT-proBNP/BNP

- Criteria: overnight admission and one of the following: RCRI ≥ 1, age ≥ 65, or age 45-64 with significant cardiovascular disease
- Threshold values are different for each test (BNP or NTproBNP) for triggering postoperative monitoring with troponin

Referral for Anesthesia Consult

- Perioperative risk discussion and planning
- If NT-proBNP is unexpectedly high without an obvious cause, consider further evaluation, including a physical exam and echocardiogram
- Communicate risk estimates with patient based on RCRI score or elevated NT-proBNP values [8% for 200-1500 pmol/mL, and 16% for > 1500 pmol/mL, risk of death is 1.4% and 4.0% respectively] [8]

Postoperative Monitoring

- Measure Troponin daily x 2-3 days (should not prolong hospitalization for troponin monitoring)
- If Troponin > 99th percentile, MINS management required [1]
- Obtain EKG and troponin level in PACU
- Consider in-hospital shared-care management

Communicate with Primary Care Provider for Outpatient Follow-up

 Establish follow-up plan for MINS positive patients after discharge from hospital given their increased risk of postoperative mortality

DELIRIUM

Postoperative delirium is one of the most common complications following major surgery. While many cases may be preventable, it may affect up to half of older adults and often goes unrecognized. It is associated with increased postoperative complications, length of stay in hospital, non-home discharge, mortality, and healthcare costs, as well as decline in function and cognition. [1-4]

Screening Tools

The Delirium Elderly At-Risk (DEAR) instrument has been used to predict postoperative delirium in elective and emergency orthopedic patients based on cognitive impairment, age, functional dependence, sensory impairment, and chronic substance use. "Among arthroplasty patients, having two or more risk factors was associated with an eight-fold increase in the incidence of delirium." (1) The modified DEAR (mDEAR) uses routinely collected medical record data to assess cognitive impairment instead of the MMSE utilized in the DEAR and attributes 2 points to cognitive impairment and 1 point to each other factor. A patient scoring 3 or more indicates a higher risk of developing delirium. ^[5]

Modified Delirium Elderly at Risk (mDEAR) Tool

	YES	NO	
 Cognitive Impairment Has the patient been disoriented to person, place, time or situation? Does patient have a history of confusion or forgetfulness? Does the patient have a history of cognitive impairment, memory loss, inattention or difficulty concentrating? 	-		
2. Patient Age- Age ≥ 80 years old			
 Sensory Impairment Patient is hearing impaired; OR Patient has low vision 	П		
Functional Status Dependence in 1 or more activity of daily life (ADL)			
 5. Substance Use Patient consumes > 3 drinks of alcohol per week; OR Patient takes benzodiazepines > 3 times per week Examples include: Alprazolam (Xanax), Clonazepam (Klonopin), Diazepam (Valium), Lorazepam (Ativan) and Temazepam (Restoril) 		-	
SCORING Assign 2 points for question 1, and 1 point each for questions 2-5			

Ö

mDEAR score ≥3

٠

Patient Education

► Discuss delirium risk and nonpharmacological delirium prevention

·

Referral for Comprehensive Geriatric Assessment (CGA)

Perioperative Strategies

Patient Education

- Discuss perioperative risk of delirium
- Non-pharmacological delirium prevention:
 - Reorientation
 - Access to natural light and a visible clock
 - Bring hearing aids and glasses and put them on in the daytime
 - · Early mobilization
 - Family presence
- Refer to online patient resources

Referral for Comprehensive Geriatric Assessment (CGA)

- Several studies have shown that CGA-based care can reduce the risk of postoperative delirium. This is attributed to better identification of delirium risk factors and proactive initiation of multimodal delirium risk management in higher risk patients ⁽⁶⁾
- Refer to online provider resources for provincial geriatrician resources and telehealth consultation options

Perioperative Strategies

- Minimize polypharmacy
- Avoid prolonged fasting of fluids

FRAILTY

Frailty is a clinical state of increased vulnerability due to age-associated decline in physiological reserve, resulting in compromised ability to cope with external everyday or acute stressors. [1]

Preoperative frailty is associated with increased postoperative complications, mortality, and longer-term negative outcomes, including falls, lower quality of life, non-home discharge, and prolonged length of stay. [2,3]

Screening Tools

The FRAIL scale has been validated as a preoperative screening tool for frailty and as a predictor of mortality and postoperative complication. ^[4] Many geriatricians find ADLs and IADLs as a useful adjunct to a screening tool.

FRAIL Scale

Fatigue: Have you felt fatigued all or most of the time in the last month?

Resistance: Cannot walk up one flight of stairs?

Aerobic: Cannot walk one block?

Illnesses: Do you have more than 5 illnesses?

Loss of weight: Have you lost more than 5% of your weight in the last 6 months?

SCORING Add 1 for every **YES**

 ≥ 3 = frail | 1 or 2 = prefrail

From Morley JE, Vellas B, Abellan van Kan G, et al. J Am Med Dir Assoc 2013;14:392-397.

ADLS (Activity of Daily Living) FLAG IF ANSWER "WITH HELP" TO 1 OR MORE			
Do you take a bath	☐ On your own ☐ with help?		
Do you dress yourself	☐ On your own ☐ with help?		
Do you eat your meals	☐ On your own ☐ with help?		
Do you walk	☐ On your own ☐ with help?		
Do you use the toilet	☐ On your own ☐ with help?		
Do you brush your teeth and hair	☐ On your own ☐ with help?		
IADLS (Instrumental Activity of Daily Livin FLAG IF ANSWER "WITH HELP" TO 2 OR MORE	g)		
Do you shop for essentials such as groceries	☐ On your own ☐ with help?		
Do you do the daily housekeeping such as dishes and laundry	☐ On your own ☐ with help?		
Do you manage your personal finances, such as bills and taxes	☐ On your own ☐ with help?		
Do you prepare daily meals	☐ On your own ☐ with help?

Have you fallen in the past year?

Ö

FRAIL Scale ADL/IADL Screening

:

Score ≥ 3 (Frail)

And/Or Dependent for ≥ 1 ADL/ ≥ 2 IADL

Patient Education

► Physical activity and nutrition resources

Preoperative Risk Discussion

► Goals of care

► Substitute decision maker

► Cognitive assessment

Referral for Comprehensive Geriatric Assessment (CGA)

Patient Education

 Refer to online patient resources for frailty-specific physical prehab and nutrition resources, including information on how to access physiotherapy for patients with frailty

Preoperative Risk Discussion

- Assess goals of care and advance care plan (e.g., complete MOST form)
- Identify substitute decision maker
- Assess for cognitive impairment and ability to provide consent for surgery
- Refer to online provider resources for assessment tools (e.g., Mini-Cog or MMSE)

Referral for Comprehensive Geriatric Assessment (CGA)

- Referral to geriatrician can be useful prior to moderate/highly invasive surgery
- If no local specialist, refer to online provider resources for telehealth consultation options

GLYCEMIC CONTROL

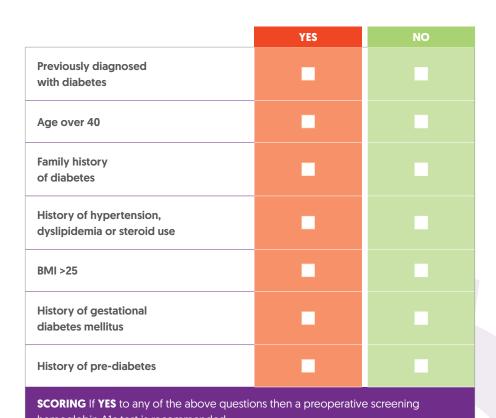

Studies have reported an association between hyperglycemia and adverse infectious and cardiovascular outcomes after cardiac and noncardiac surgery. [1-5] Many studies recommend delaying elective surgery until HbA1c levels are below 8.5, recognizing that this may not be feasible for all patients and that such a cutoff is not currently supported by robust evidence. [6-10]

Screening Tools

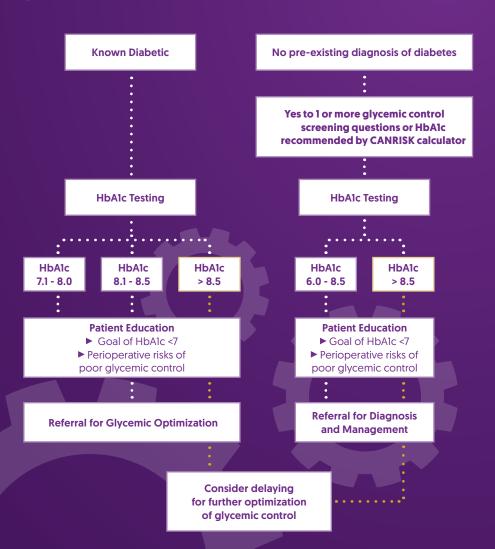

Glycemic Control Screening Questions extrapolated from BC Guidelines for Diabetes Care [1]

The CANRISK questionnaire is a validated risk tool for patients to self-assess their diabetes risk. [11]

hemoglobin A1c test is recommended.

Ö

Patient Education

- Reinforce general goal of A1c less than 7^[12]
- Explain perioperative risks of hyperglycemia
- Refer to online patient resources
- If no previous diabetes diagnosis:
 - HbA1c 6.0-6.4: likely prediabetic
 - HbA1c > 6.5: likely diabetic

Referral for Diabetes Diagnoses and Management (no pre-existing diabetes)

- Encourage follow-up with primary care provider for confirmation of diabetes diagnosis and initiation of management
- Refer to online provider resources for referral templates

Referral for Glycemic Optimization (known diabetes)

- Request re-evaluation from physician directing diabetes care with the goal of improving blood glucose control prior to surgery, if feasible
- If holding GLP-1 agonist for a prolonged duration, adding other antihyperglycemic medication may be required
- Refer to online provider resources for telehealth consultation options and referral templates

Consider Delaying for Glycemic Optimization

- Discuss concerns, including potential benefits and risk of delaying surgery, with surgical team, particularly for total joint arthroplasty, vascular surgery, and spine surgery with instrumentation
- Refer to local diabetes expert or online provider resources for telehealth consultation options

GOALS OF CARE

One in three high-risk patients choosing surgery will experience serious medical complications leading to long-term decline in health and quality of life. Often patients do not receive the information they need to make an informed decision about surgery. [1]

Shared decision making is a collaborative process between clinicians and patients, which aims to select the most suitable treatment option based on best available evidence and informed patient preferences. [1]

Screening Tools

- Do you have an advanced care plan a list of instructions to help guide a trusted person to make healthcare treatment decisions on your behalf if required?
- Have you identified a substitute decision maker someone you trust to make healthcare treatment decisions on your behalf if you are unable to do it yourself?
- Is the patient at higher risk of perioperative complications?
 (e.g., advanced age, frailty, poor functional capacity, moderate/highly invasive surgery, multiple comorbidities)

Optimization is recommended for patients that answer No to question 1 or 2, or Yes to question 3.

Patient Education	0	Refer to online patient resources
Preoperative Goals of Care Discussion	0	Use the best-case scenario / worst-case scenario framework [2]
Referral for Comprehensive Geriatric Assessment (CGA)	0	Consider preoperative assessment by Geriatrics to delineate risk

MENTAL WELLBEING

Significant anxiety and depression are associated with increased postoperative pain, prolonged hospital length of stay, and hospital readmission, as well as many other postoperative complications. ^[1,2] Preoperative education and expectation setting can help reduce postoperative anxiety, depression, and length of stay, and improve patient experiences and outcomes. ^[3,4]

Screening Tools

The Patient Health Questionnaire-2 (PHQ-2) is an initial screening tool for depression, comprising the first two questions of the Patient Health Questionnaire-9 (PHQ-9). A PHQ-2 score of 3 or more warrants completion of the PHQ-9. ^[5,6]

The General Anxiety Disorder-2 (GAD-2) is an initial screening tool for generalized anxiety disorder (GAD), comprising the first two questions of the General Anxiety Disorder-7 (GAD-7). A GAD-2 score of 3 or more warrants completion of the GAD-7 scale. ^[7]

While no scale is diagnostic, these tools are intended to help identify pre-surgical patients who may be experiencing more significant symptoms, who may benefit from targeted pre-surgical intervention.

Patient Health Questionnaire [PHQ-9]

OVER THE LAST 2 WEEKS , HOW OFTEN HAVE YOU BEE BOTHERED BY ANY OF THE FOLLOWING PROBLEMS?	N NOT AT ALL	SEVERAL DAYS	MORE THAN HALF THE DAY	NEARLY EVERY DAY				
1. Little interest or pleasure in doing things	0	1	2	3				
2. Feeling down, depressed, or hopeless	0	1	2	3				
Trouble falling or staying asleep, or sleeping too much	0	1	2	3				
4. Feeling tired or having little energy	0	1	2	3				
5. Poor appetite or overeating	0	1	2	3				
6. Feeling bad about yourself — or that yo are a failure or have let yourself or your family down	0	1	2	3				
7. Trouble concentrating on things, such as reading the newspaper or watching television	on	1	2	3				
8. Moving or speaking so slowly that other people could have noticed? Or the opposi — being so fidgety or restless that you have been moving around a lot more than usual	101	1	2	3				
9. Thoughts that you would be better off dead or of hurting yourself in some way	0	1	2	3				
SCORING PHQ-9 This is calculated by assigning scores of 0, 1, 2, and 3 to the response categories, respectively, of "not at all," "several days," "more than half the days," and "nearly every day." PHQ-9 total score for the nine items ranges from 0 to 27.								
0-4: Minimal depression 15-19 Moderately severe depression 5-9: Mild depression 20-27: Severe depression 10-14: Moderate depression								

Developed by Drs. Robert L. Spitzer, Janet B.W. Williams, Kurt Kroenke and colleagues, with an educational grant from Pfizer Inc. No permission required to reproduce, translate, display or distribute.

Generalized Anxiety Disorder Questionnaire [GAD-7]

п

OVER THE LAST 2 WEEKS , HOW OFTEN HAVE YOU BEEN BOTHERED BY ANY OF THE FOLLOWING PROBLEMS?	NOT AT ALL	SEVERAL DAYS	MORE THAN HALF THE DAY	NEARLY EVERY DAY				
1. Feeling nervous, anxious, or on edge	0	1	2	3				
Not being able to stop or control worrying	0	1	2	3				
3. Worrying too much about different things	0	1	2	3				
4. Trouble relaxing	0	1	2	3				
5. Being so restless that it is hard to sit still	0	1	2	3				
6. Becoming easily annoyed or irritable	0	1	2	3				
7. Feeling afraid, as if something awful might happen	0	1	2	3				
SCORING GAD-7 Anxiety Severity This is calculated by assigning scores of 0, 1, 2, and 3 to the response categories, respectively, of "not at all," "several days," "more than half the days," and "nearly every day." GAD-7 total score for the seven items ranges from 0 to 21.								
0-4: minimal anxiety 10-14: moderate anxiety 5-9: mild anxiety 15-21: severe anxiety								

Source: Primary Care Evaluation of Mental Disorders Patient Health Questionnaire [PRIME-MD-PHQ]. The PHQ was developed by Drs. Robert L. Spitzer, Janet B.W. Williams, Kurt Kroenke, and colleagues. For research information, contact Dr. Spitzer at ris8@columbia.edu. PRIME-MD® is a trademark of Pfizer Inc. Copyright© 1999 Pfizer Inc. All rights reserved. Reproduced with permission

Complete both the PHQ and GAD questionnaires to assess risk of depression and anxiety.

PHQ-2

Score ≥ 3 Complete PHQ-9

Score 5-9

Patient Education Self-Referral Options Score 10-14

Physician Referral to mind-space.ca

Score ≥ 15

OR Yes to self-harm thoughts Urgent referral to Psychiatry/Primary Care

GAD-2

Score ≥ 3 Complete GAD-9

Score 5-9

Patient Education Self-Referral Options Score 10-14

Physician Referral to mind-space.ca

Score ≥ 15

Referral to Psychiatry or Primary Care

Patient Education

- Set patient expectations for postoperative anxiety management
- "Based on your responses, it sounds like you might be feeling anxious or experiencing low moods at times. Your mental wellbeing affects your ability to recover well after surgery. Other patients have found these resources to be helpful in the past."
- Refer to online patient resources

Self-Referral Options

- Encourage patient to seek help from at least one of the following options
 - Primary care appointment to discuss mental health (provide patient with their PHQ-9 and GAD-7 scores)
 - Help Starts Here or 211 for online/telephone access to local supports and resources
 - 310-6789 BC mental health and crisis response line
 - 988 national suicide crisis helpline

Physician-Referral Options

- Mild to Moderate symptoms (PHQ-9 score: < 15): refer to mind-space.ca
- © Severe symptoms (PHQ-9 score: ≥ 15)

NUTRITION

Malnutrition is present in approximately 45% of patients at time of admission to hospital. It is often underrecognized and is associated with increased postoperative complications and in-hospital and 30-day mortality. Nutrition risk is also associated with increased length of stay, readmission, and hospital costs. [1-5] Preoperative & early postoperative nutritional intervention are associated with improvements in postoperative complications and mortality. [6]

Screening Tools

The Canadian Nutrition Screening Tool (CNST) is a valid and reliable screening tool to identify those patients at risk of malnutrition in the adult acute care environment. ^[1]

CANADIAN NUTRITION SCREENING TOOL (CNST)

Name:	Age:	Weight:	Room:

Identify patients who are at risk for malnutrition

	Date:		Date:		
	Admi	ssion	Rescreening		
Ask the patient the following questions*	Yes	No	Yes	No	
Have you lost weight in the past 6 months WITHOUT TRYING to lose this weight? If the patient reports a weight loss but gained it back, consider it as NO weight loss.					
Have you been eating less than usual FOR MORE THAN A WEEK?					

Two "YES" answers indicate nutrition risk[†]

Patients at nutrition risk need an assessment to confirm malnutrition

Nutrition screening using a valid tool can generate a significant volume of requests for nutrition evaluation. Subjective Global Assessment (SGA) is a simple and efficient first-line assessment of nutritional status that can be used following a positive screening and to help prioritize cases.

If a patient is malnourished (SGA B or C), an in-depth nutrition assessment, along with treatment, is required by a registered dietitian.

The Canadian Nutrition Screening Tool was rigorously validated and tested for reliability in Canadian hospitals. Non-expert raters completed the tool and it was compared to the SGA conducted by a dietitian or trained nutrition researcher.

† If a patient is not at risk, rescreen within a week. Only consider weight change in the past week.

Validation and reliability testing of the Canadian Nutrition Screening Tool was funded by an unrestricted advertiged great of Abbott Nutrition Canada

^{*} If the patient is unable to answer the questions, a knowledgeable informant can be used to obtain the information. If the patient is uncertain regarding weight loss, ask if clothing is now fitting more loosely.

0

Screening with Canadian Nutrition Screening Tool

CNST 2

Risk of Malnutrition

:

Patient Education

► 1.2-2.0 g/kg body weight of protein each day

•

Referral for Nutrition Counselling

Patient Education

- Patients that are at high risk for malnutrition (CNST 2) require dietician assessment. It is essential that the patient is able to meet their energy, carbohydrate, and protein needs prior to surgery. For 2-4 weeks prior to surgery an increase in dietary protein (aiming for 1.2-2 g/kg/day) may be recommended.
- Refer to online patient resources

Referral for Nutrition Counseling

- Dietician to confirm diagnosis of malnutrition and advise dietary plan for optimized nutrition before surgery
- Refer to online provider resources for dietician resources and referral templates

OBESITY

Obesity is linked to several conditions, such as type II diabetes and obstructive sleep apnea, that may increase perioperative risks. Comorbidities may outweigh BMI in assessing these risks. [1-4]

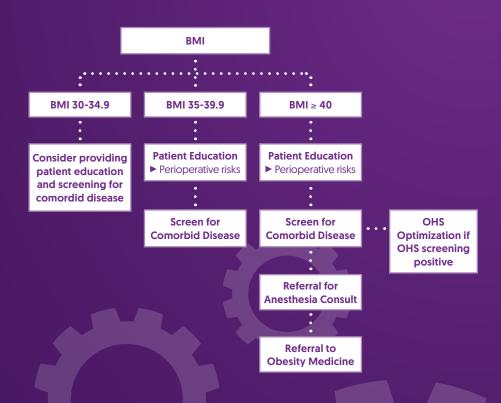

For patients with class 1* obesity (BMI: 30–34.9), perioperative risks are mainly limited to venous thromboembolism. In class 2* obesity (BMI: 35–39.9) and higher, there is a modest increase in risks, including postoperative pulmonary complications, wound infections, longer hospital stays, increased blood loss, longer surgeries, and renal failure. ^[5-8]

Although high BMI is associated with higher perioperative risks, there is limited research on the effects of preoperative weight loss through diet and limited evidence to suggest delaying surgery based on BMI. [9]

*Classification is based on Caucasian populations. Lower cutoffs have been recommended for other ethnicities. ^[10]

Screening Tools

Although BMI is easy to obtain and therefore used to identify and categorize severity of obesity, integrating other indices (e.g., waist to hip ratio, waist circumference, and percent body fat) may improve predictions of metabolic health, comorbid conditions, and perioperative risk stratification. [1-3]

Patient Education

- Counsel patients on obesity-related perioperative risks, recognizing that stigma and bias can worsen morbidity and mortality
 - Ask permission to measure and discuss weight as it impacts surgical risk "Would it be okay if we discussed your weight today as it impacts your anesthetic and surgical care?"
- Refer to online provider resources for information on communicating and treating obese patients

Screen for Comorbid Disease

- Obstructive Sleep Apnea (OSA)
 Refer to sleep apnea section
- Obesity Hypoventilation Syndrome (OHS)
 See below
- Diabetes

 Refer to glycemic control section
- Cardiovascular disease risk stratification Refer to cardiac section
- Kidney disease

Obesity Hypoventilation Syndrome (OHS)

- Initial Screen for OHS
 - Complete Room air ABG if BMI ≥ 50 or BMI ≥ 35 and STOP-Bang ≥ 6 and HC03 ≥ 27
 - For patients with BMI < 50, a serum HCO3 < 27 effectively rules out OHS
- Room air PaCO2 ≥ 45 mmHg suggests OHS, but other potential causes of hypercapnia need to be ruled out for a definitive diagnosis
- If OHS suspected:
 - · Referral for Anesthesia consult
 - · Referral to Sleep Medicine
 - Preoperative investigations
 - · Chest X-ray
 - · Echocardiogram
 - · Spirometry

Referral for Anesthesia Consult

• To allow for assessment of and planning for the perioperative management of comorbid conditions (e.g.,OSA, OHS) and other factors such as airway management, vascular access, and patient positioning (II)

Consider Referral to Obesity Medicine

- Recommended for patients with significant comorbid disease
- Refer to online provider resources for obesity medicine providers

OBSTRUCTIVE SLEEP APNEA

Obstructive sleep apnea (OSA) is a chronic medical condition that is commonly undiagnosed. The most common form of sleep-disordered breathing, it is characterized by recurring transient obstructions of airflow that occur exclusively during sleep. OSA is associated with increased risk of perioperative complications, including postoperative respiratory failure, cardiac events, and ICU transfer, and should be identified and treated as early as possible to help reduce this risk. [1-7]

Screening Tools

The STOP-Bang questionnaire is a validated tool for preoperative screening for OSA, assessing the likelihood of moderate to severe OSA. Scores of 5 or higher indicate a high probability of moderate to severe OSA. [8]

STOP-Bang Score Pre-Existing OSA Diagnosis Score 3-4 Score ≥ 5 **Intermediate Risk** High Risk **Patient Education Patient Education Patient Education** ► Perioperative and ► Perioperative and ► Perioperative and long-term risks of long-term risks of long-term risks of untreated OSA untreated OSA untreated OSA Referral for **Diagnostic Testing** Referral for Referral for **Anesthesia Consult Anesthesia Consult Screening for Comorbid Diseases**

Consider delaying for further treatment of OSA

Patient Education

- Counsel patients on the perioperative and long-term risks of untreated moderate or severe obstructive sleep apnea
- For pre-existing OSA diagnosis:
 - Instruct patient to continue using their treatment device (e.g., CPAP, BPAP, or dental device) until their surgery, and bring it to hospital, including for daycare surgery
 - Request sleep study results from primary care provider if not available on electronic health record
 - If patient is not using their treatment device as prescribed, emphasize the importance of its use in the postoperative period and suggest they follow up with their family doctor or device vendor to discuss barriers to use and potential solutions

Referral for Diagnostic Testing

- Home Sleep Apnea Test (HSAT) (without Sleep Disorder Physician consultation)
 - See Form A for inclusion and exclusion criteria.
 This testing should be ordered by a physician who is responsible for the longitudinal care of a diagnosis of sleep apnea.
- Sleep Disorder Consultation Referral
 - Sleep physicians will determine the appropriate testing modality and follow for therapy
 - Use for patients that are not appropriate for HSAT
- See online provider resources for referral templates

Referral for Anesthesia Consult

- Consider referral in patients coming for moderate to severely invasive surgery, airway surgery, or those with severe OSA not compliant with CPAP
- To plan for postoperative management & monitoring to minimize OSA related perioperative complications

Screening for Comorbid Disease

- Obesity Hypoventilation Syndrome (see Obesity)
- Diabetes
- Cardiovascular / Respiratory complications

Consider delaying for further treatment of OSA

- Made on a case by case basis taking into consideration:
 - · Patient's overall health
 - Urgency of the surgery
 - Potential impact of untreated OSA on the surgical outcome
- In the vast majority of cases there is insufficient evidence to support delaying surgery for testing/ treatment unless there is evidence of significant or uncontrolled systemic disease or additional problems with ventilation or gas exchange.

 Continuation with surgery is reasonable if the patient is managed perioperatively as though they have untreated moderate to severe OSA [9]

PAIN MANAGEMENT

Significant acute postoperative pain is common, even among those on an established pain management protocol. [1]

Pain after surgery is associated with increased risk of postoperative readmission to hospital, emergency department visits, myocardial injury, delirium, and chronic pain. [2-7] Postoperative pain control may be improved by addressing modifiable patient risk factors such as sleep, BMI, depression, anxiety, and preoperative pain. [8]

Screening Tools

The Perioperative Opioid Quality Improvement (POQI) score is an algorithm being developed at St. Paul's Hospital. It aims to identify patients at increased risk of significant postoperative pain and long-term opioid use, so that their care plans may be tailored with the intent of helping reduce initial opioid consumption. ^[9] It incorporates several variables associated with increased risk for developing postoperative pain and uses consumption of > 90 morphine milligram equivalents per day while inpatient after surgery as a surrogate marker for assessing performance. ^[9] While the POQI score is not validated, it was selected to support postoperative pain risk stratification based on local BC experience with the tool. A POQI score ≥ 7 is considered to be 'increased risk.'

	YES	Scoring (if Yes)
History of chronic pain		4
History of anxiety or panic attacks		2
History of depression		2
History of poorly controlled pain after surgery		2
Current prescription for opioids		5
Current prescription for benzodiazepines		4
Current prescription for antidepressants		4
Recreational drug use (history of or present)		4
Substance use disorder (history of or present)		5
Age <40		1
Female		2
SCORING Add all YES scores together for a total between 0-35.		

PAIN MANAGEMENT ALGORITHM

POQI Score ≥ 7

Self-Referral Options

Physician Referral Options

Managing Pain
Before and After
Surgery Course
Coaching for Health

Patients with
chronic pain:
Referral to chronic

pain clinic

Referral for Anesthesia Consult to develop pain management strategies

Patient Education

- Set patient expectations for postoperative pain management
- "Given your risk factors, managing post-surgery pain might be challenging. There are many ways we can work together before and after surgery to decrease this."

Self-Referral Options

- Refer to online patient resources including access to the following:
 - Managing Pain Before and After Surgery (PainBC): A free self-paced online program for people having surgery and their families to better manage pain after surgery and decrease complications
 - Coaching for Health (PainBC): A free one-onone telephone coaching program designed to help people living with chronic pain learn selfmanagement skills, regain function, and improve well-being

Referral for Anesthesia Consult

To develop effective pain management strategies and explore options for anesthesia and postoperative pain control, especially in moderate to severely invasive surgery

Physician-Referral Options

- Physician-Referral Mind-space.ca Mindfulness teaching virtually
 - Referral to Transitional Pain Clinic
 - Transitional pain clinics are short-term outpatient services that manage pain before and after surgery to prevent acute pain from becoming chronic. Currently available at Vancouver Coastal Health and Providence Health sites.
 - Referral to Chronic Pain Clinic

PHYSICAL ACTIVITY

Poor functional capacity and physical fitness are associated with poor surgical outcomes including prolonged hospital length of stay and increased risk of postoperative complications. Increasing physical fitness can improve resilience and recovery after surgery. [1,2]

Screening Tools

The Physical Activity Vital Sign (PAVS) Calculator is a quick and easy way to flag sedentary patients for referral and counseling.

The Physical Activity Vital S	Sign						
On average, how many days per week do you engage in moderate to strenuous exercise (like a brisk walk)?	days						
2. On average, how many minutes do you engage in exercise at this level?	minutes						
Total minutes per week of physical activity (multiply #1 by #2) minutes per week							

Using the Physical Activity Vital Sign

- National guidelines recommend 150 minutes per week of moderate intensity physical activity.
 Moderate intensity activity is usually done where an individual can talk, but cannot "sing".
 Examples include: brisk walking, slow biking, general gardening, and ballroom dancing.
- In place of moderate intensity activity, an individual can also complete 75 minutes of vigorous intensity physical activity. Vigorous intensity activity is done at a pace where individuals can no longer talk and are somewhat out of breath. Examples include: swimming laps, playing singles tennis, and fast bicvcling.
- Individuals can also achieve 150 "minutes" through a combination of moderate and vigorous intensity physical activity, with 1 minute of vigorous activity being equal to 2 minutes of moderate activity.
- If activity is done throughout the day, individuals are encouraged to perform activity in "bouts" that
 are at least 10 minutes in length.
- If your patient is NOT achieving 150 minutes a week of physical activity, advise them to gradually
 increase either their frequency or duration until they are capable of safely performing 10 minutes
 bouts of activity and achieve national recommendations.

The Physical Activity Vital Sign - Other Considerations

- A comprehensive assessment of physical activity should include promotion of active living throughout the day to reduce sedentary time, as well as muscle strengthening and flexibility exercises as recommended by the Physical Activity Guidelines for Americans.
- If you wish to add a question on muscle strengthening activities, we would recommend the following question:

How	many	days	а	week	do	you	perform	muscle	strengthening	exercises,	such	as	bodyweight
exer	cises o	r resis	tar	ice trai	ining	g?		days					

Ö

Physical Activity
Vital Sign Screening

:

< 150 minutes/week of moderate to vigorous activity

Assess for Medical Limitations

- ► Frailty (FRAIL Scale ≥ 3)
- ► Symptomatic Cardiorespiratory Disease
 - ► Chronic Pain
 - ► Inflammatory Arthritis
 - ► Neurological Conditions

No Medical Limitations

Medical Limitations

Patient Education

- ▶ 150 min moderate- to vigorous-intensity exercise per week
- ► Muscle and bone strengthening activities 2 x per week
- ► Self-guided exercise program
 - ► Choose to move physical activity coaching

Referral for Tailored Prehabilitation

Patient Education

- Recommend at least 150 min of moderate- to vigorous-intensity aerobic physical activity per week, in bouts of 10 minutes or more
 - Moderate intensity activity: brisk walk or riding a bicycle; you can talk but not sing
 - Vigorous intensity activity: jogging or swimming; you are out of breath and can talk but do not want to
- Recommend muscle- and bone-strengthening activities at least 2 days per week
- Refer to online patient resources for preoperative exercise program
- Refer to the FREE Choose to Move program for personalized physical activity coaching and support. Participants set goals, build a tailored physical activity plan, and connect with peers while receiving information on health and wellness. In-person and online programs available.

Referral for Tailored Prehabilitation

- Consider referral to physiotherapy for tailored preoperative exercise guidance for patients with medical limitations such as:
 - Frailty (See frailty)
 - Symptomatic cardiorespiratory disease
- · Chronic pain
- · Inflammatory arthritis
- Neurological conditions
- Refer to online provider resources for physiotherapy resources, referral templates, and information on who can access physio for free in BC

SMOKING CESSATION

Cigarette smoking is a risk factor for perioperative pulmonary, cardiovascular, bleeding and wound healing complications. ^[1,2] There is some evidence that vaping (or the use of e-cigarettes) is also associated with these complications. ^[3] The likelihood that quit-motivated patients can abstain from smoking is increased by use of nicotine replacement therapy [NRT]. ^[4]

Screening Tools

Screening Questions:

- Do you currently use products that contain tobacco or nicotine? (e.g., smoking cigarettes or e-cigarettes, vaping nicotine, or chewing tobacco)
- If Yes, what type of tobacco/nicotine product?
- If cigarettes, how many packs/day? If other, how much & how often?

ASK about tobacco/nicotine use ADVISE users to quit ASSESS readiness to make a quit attempt ASSIST

ARRANGE follow-up care

with the quit attempt

- ▶ What do you smoke?
- ▶ How much do you smoke?
- ▶ How long have you smoked?

Discuss risks and impacts for surgery and urge patient to quit

Ask if patient is willing to quit

Provide resources for quitting

- ▶ Encourage quit plan
- Recommend physician or pharmacist support for pharmacotherapy
- Provide online/telephone resources

Encourage patient book follow-up appointment with primary care. Revisit smoking cessation discussion on day of surgery.

Patient Education

5 A's Algorithm for Smoking Cessation (5)

- ASK about tobacco/nicotine use
 - · See screening questions
- ADVISE to quit
 - Strongly urge all tobacco users to quit in a clear, strong, personalized manner
 - "It is extremely important for you to quit smoking before surgery. Smoking and vaping have a huge impact on your heart and lung health and increase the risk of complications after surgery. Quitting or cutting back on smoking before surgery can:
 - lower your risk of getting pneumonia after surgery,
 - reduce your risk of having a heart attack during/after surgery,
 - speed up your healing after surgery, which reduces your risk of infection."
- ASSESS readiness to make a quit attempt
 - "Are you willing to try to quit before surgery?"

Patient Education CONTINUED

ASSIST with the quit attempt

- "Stopping smoking is not solely about willpower.
 Your body may be addicted to or dependent on nicotine and quitting can be difficult."
- Quit Plan: Encourage patients to set a quit date, tell family/friends, remove tobacco products from the environment, plan for withdrawal symptoms and cravings
- Recommend pharmacotherapies ⁽⁶⁾: Medications & Nicotine Replacement Therapy can increase smoking cessation success and reduce withdrawal symptoms (e.g., patch, gum, sprays, or oral medication). Family doctors or pharmacists are able to arrange therapies and ensure these therapies are covered financially through PharmaCare. Refer to online patient resources for covered therapies.
- Provide resources for quitting: [6]
 - · Quit Now
 - Healthlink or *211 to access support through live chats, telephone and connection with local smoking cessation resources
 - Online patient resources
- ARRANGE follow-up care
 - See referral for follow-up below

Referral for Follow-up

- Outpatient follow-up:
 - Encourage patients to schedule follow-up with their primary care provider for 2 weeks time to discuss progress
- Day of Surgery revisit smoking cessation:
 - If still smoking: Normalize that lapses are very common and reassure that stopping smoking is not solely about willpower. Many people require more than one attempt. Reinforce the benefits of smoking cessation postoperatively, and offer further resources if appropriate (such as pharmacotherapy if it was not utilized with last quit attempt).

ALCOHOL

Preoperative alcohol use is associated with an increased risk of postoperative morbidity, infections, wound complications, pulmonary complications, prolonged hospital length of stay, and admission to intensive care. ^[1] Screening for alcohol misuse prior to elective surgery allows for further screening for health complications, planning for those at risk of complicated withdrawal, and offering resources for safe tapering preoperatively in those patients who are motivated to do so.

Screening Tools

The Alcohol Use Disorder Identification Test (AUDIT-C) is an effective and validated 3-question screen for severity of alcohol misuse that is based on the 10-question AUDIT questionnaire. ^[2]

Alcohol Use Disorder Identification Test [AUDIT-C]

1. Within the past year, how often did you have a drink of alcohol?	□ a. Never □ b. Monthly [e.g. Special occasions/Rare] □ c. 2-4 times a month [e.g. 1x on weekend - "Fridays only" or "every other Thursday"] □ d. 2-3 times a week [e.g. weekends - Friday-Saturday or Saturday-Sunday] □ e. 4 or more times a week [e.g. daily or most days/week]
2. Within the past year, how many standard drinks containing alcohol did you have on a typical day?	□ a. 1 or 2 □ b. 3 or 4 □ c. 5 or 6 □ d. 7 to 9 □ e. 10 or more
3. Within the past year, how	□ a. Never □ b. Less than monthly

☐ c. Monthly

☐ d. Weekly

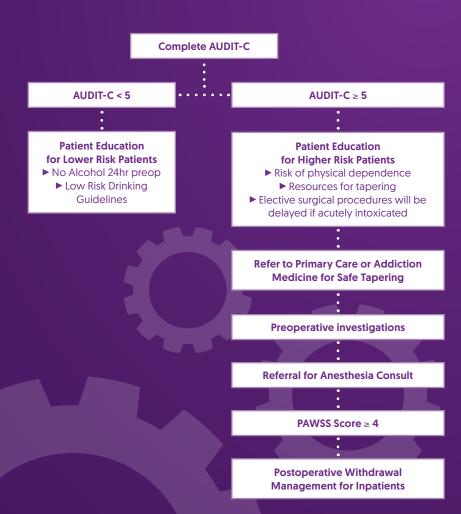

☐ e. Daily or almost daily

SCORING The AUDIT-C is scored on a scale of 0-12. a = 0 points, b = 1 point, c = 2 points, d = 3 points, e = 4 points

often did you have six or more drinks on one

occasion?

ODSTANCE OSE ALCOHOL ALGORITI

Patient Education for Lower Risk Patients (AUDIT-C < 5)

- "Frequent alcohol use before surgery can affect how your body responds to medications. It also decreases your body's ability to fight infection and heal properly. There are many ways that your healthcare team can help you to safely cut down or stop using alcohol. It is important to not use alcohol for at least 24 hours prior to surgery."
- Discuss Canadian Low Risk Drinking Guidelines:

 "Research shows that no amount or kind of alcohol is good for your health. It doesn't matter what kind of alcohol it is—wine, beer, cider or spirits. Drinking alcohol, even a small amount, is damaging to everyone, regardless of age, sex, gender, ethnicity, tolerance for alcohol or lifestyle. That's why if you drink, it is better to drink less." Canada's Low Risk Drinking Guide suggests that:
 - 0 drinks per week has benefits such as better health and better sleep.
 - 1 to 2 standard drinks per week: You will likely avoid alcohol-related consequences for yourself and others
- Refer to online patient resources for information on safe alcohol consumption and reduction
- Telephone service: 24-hour BC Alcohol and Drug Information and Referral Service toll-free from anywhere in B.C. at 1-800-663-1441

Patient Education for Higher Risk Patients (AUDIT-C \geq 5)

- **Frequent alcohol use before surgery can affect how your body responds to medications. It also decreases your body's ability to fight infection and heal properly. There are many ways that your healthcare team can help you to safely cut down or stop using alcohol. It is important to not use alcohol for at least 24 hours prior to surgery, however, if you use alcohol daily you could be physically dependent. That means it can be dangerous to stop drinking overnight or cold turkey."
- Advise patients that elective surgical procedures will be delayed if they are acutely intoxicated
- Patient resources:
 - Make an appointment to see your primary care provider (e.g., family doctor)
 - Call 811 to speak to a healthcare navigator who can find resources near you to help you slowly and safely reduce your alcohol use prior to surgery
 - Refer to online patient resources

Referral for Safe Tapering

 Primary care or Addiction Medicine for management suggestions

Preoperative Investigations	 Screening for complications of alcohol use: CBC INR/PTT Albumin ALP ALT GGT
Referral for Anesthesia Consult	• Especially if inpatient stay required
PAWSS Score	 To assess risk of complicated withdrawal
	PAWSS score ≥ 4 indicates high risk of complicated withdrawal
Postoperative Withdrawal Management for	 Consider involving Addiction Medicine in hospital especially if PAWSS ≥ 4. Alcohol withdrawal management postoperative
Inpatients	orders (CIWA)

CANNABIS

Cannabis (marijuana) use may lead to increased anesthetic requirements, postoperative pain, opioid use after surgery, and nausea and vomiting. [1-3] Smoking cannabis increases the risk of pulmonary complications, cardiovascular complications (including postoperative myocardial infarction), and in-hospital mortality; it may also increase airway irritation, carboxyhemoglobin, and reduce oxygen-carrying capacity, similar to conventional cigarette smoking. [3-5]

Screening Tools

Cannabis Screening Questions:

- Do you use Cannabis? If Yes:
 - · How often?
 - How much do you use?
 - How are you using it? (e.g., smoking, vaping, tincture/oil, edibles, cream)
 - Have you ever had symptoms like headaches, anxiety, poor sleep, or stomach pain when you stopped using cannabis for a day or two (Cannabis Withdrawal Syndrome)?

Patient Education

- Advise patients on perioperative risks of cannabis use (1,2)
 - "Cannabis use puts you at higher risk of heart attacks and lung complications as well as nausea and vomiting and increased pain after surgery."
 - "It is best to stop using cannabis for at least 72 hours before surgery. This does not apply to creams."
- Advise patients that elective surgical procedures will be delayed if they are acutely intoxicated
- Discuss Canada's Lower Risk Cannabis Use Guidelines: ^[6]
 - Choose low-strength products, such as those with a lower THC content or a higher ratio of CBD to THC
 - Avoid using synthetic cannabis products
 - Smoking cannabis (for example, smoking a joint) is the most harmful way of using cannabis because it directly affects your lungs
- Refer to online patient resources

Recommend Self Taper

- Lower amount every day over 7 days with total cessation 72 hours prior to surgery
- "If you use a lot of cannabis on a daily basis you should slowly decrease the amount you use every day until you can stop for 72 hours without feeling unwell."
- Slow taper if experiencing symptoms of Cannabis Withdrawal Syndrome (CWS)

Referral for Supported Taper

- Consider tapering to a goal of less than the recommended preoperative maximum (rather than complete cessation 72 hours preop)
- Consider primary care, Addiction Medicine, or RACE line support

Referral for Anesthesia Consult

• To develop effective pain management strategies and explore options for anesthesia and postoperative pain control, especially in moderate to severely invasive surgery

Provide Education on Cannabis Withdrawal Syndrome ^[9]

- Usually begins 1-2 days after cessation and lasts up to 3 weeks
- Symptoms include: headaches, anxiety, poor sleep, stomach pain
- Treatment:
 - Supportive counseling and psychoeducation
 - Consider referral for supported taper or suggest slower taper (10% reduction per day)
 - No medications are approved for medically assisted withdrawal, though some are used 'offlabel' in clinical practice

ILLICIT SUBSTANCES

Substance use is associated with increased postoperative complications, prolonged hospital length of stay, and increased healthcare costs. [1-4]

Acute intoxication and chronic use have implications for perioperative care. [5]

Additional challenges depend on the severity and type of substance(s) used, as well as other factors that may be associated with substance use, including experiencing homelessness or mental illness. Collaboration with community providers is important, especially for patients being treated for opioid use disorder.

Screening Tools

Screening Questions:

- In the last 12 months, have you used drugs other than those required for medical reasons? (not including alcohol or cannabis)
- If yes, characterize drug use (drug, dose, frequency, and route of administration)

The Drug Abuse Screening Test (DAST-10) is a validated 10-item brief screening tool that assesses drug use (excluding alcohol and tobacco), in the past 12 months and gives a score of the degree of problems related to drug use and misuse. ^[6,7] This allows preoperative interventions to target those patients with substantial or severe problems related to drug abuse.

Drug Abuse Screening Test [DAST-10]

These questions refer to drug use in the past 12 months.

Please answer Yes or No.

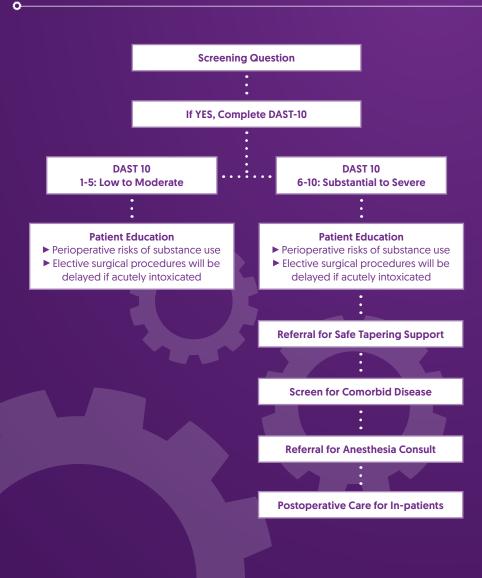

Please answer Yes or No.	YES	NO
Have you used drugs other than those required for medical reasons?		
2. Do you use more than one drug at a time?		
3. Are you always able to stop using drugs when you want to?		
4. Have you had "blackouts" or "flashbacks" as a result of drug use?	t	-
5. Do you ever feel bad or guilty about your drug use?	?	
Does your spouse (or parents) ever complain about your involvement with drugs?		
7. Have you neglected your family because of your us of drugs?	se	
8. Have you engaged in illegal activities in order to obtain drugs?		
9. Have you ever experienced withdrawal symptoms (felt sick) when you stopped taking drugs?		
10. Have you had medical problems as a result of your drug use (e.g., memory loss, hepatitis, convulsions, bleeding, etc.)?		
SCORING Score 1 point for each question answered YES <i>Except for question 3</i> for which a NO receives 1 point.

Consult

To develop effective pain management strategies and explore options for anesthesia and postoperative pain control, especially in moderate to severely invasive surgery

Postoperative Care for Inpatients

 Referral to Addiction Medicine consultative services to avoid complicated withdrawal and facilitate discharge planning and supports

SUPPORT AFTER SURGERY

Making arrangements in advance to have adequate support at home can help patients return home after surgery as soon as it is appropriate and avoid delays to discharge. ^[1,2] Traditional criteria for discharge following day surgery includes the presence of a capable adult care-giver for 24 hours postoperatively.

Screening Tools

Screening Questions:

- Do you have someone that can help you during your recovery after surgery if necessary?
- Do you have someone who can take over your caregiving responsibilities while you recover from surgery (e.g., vulnerable adults, children, or pets)?

Screening Questions

No capable adult available for the recovery period

Patient Education

- ► Importance of support after surgery
- ► Set expectations for recovery period

Patient Resources

► Direct to 211 or gov.bc.ca (QR code below) for how to arrange home care

Patient Education

- Advise patients on the importance of post-surgery support and set clear expectations for their recovery
- "Depending on what type of surgery you are having you may need to have someone help you for a while. If the plan is for you to go home the same day (daycare surgery), it is critical that you have someone to assist you on the way home as well as a responsible adult to spend the night with you."

Provide resources for those with no support

- *211 or gov.bc.ca telephone or online resource to find local home and community care services
- Refer to local social worker

ATIENT ACIIVATIO

- Assess patients' level of activation
- Assist patients to self-manage and engage in actions supporting their health and healthcare
- Implement a Shared Decision-Making process with patients

PATIENT PASSPORT FOR SURGICAL PREHABILITATION

PATIENT **ACTIVATION**

Assess patients' level of activation

Recommendations

- Understand Health Literacy
- Measure patients' Health Literacy levels (See Appendix B)
- Understand the definition of Patient Activation
- Use a Patient Activation scale in the discussion with your patients to assess their level of activation (See Appendix C)

Appendices

Appendix B · Realm-SF Score Sheet

Appendix C · Patient Activation Measure

Disengaged and overwhelmed

Individuals are passive and lack confidence. Knowledge is low, goal-orientation is weak, and adherence is poor. Their perspective: "My doctor is in charge of my health."

Level 2

Becoming aware, but still struggling

Individuals have some knowledge, but large gaps remain. They believe health is largely out of their control, but can set simple goals. Their perspective: "I could be doing more."

Level 3

Taking action

Individuals have the key facts and are building self-management skills. They strive for best practice behaviors, and are goal-oriented. Their perspective: "I'm part of my health care team."

Level 4

Maintaining behaviors and pushing further

Individuals have adopted new behaviors, but may struggle in times of stress or change. Maintaining a healthy lifestyle is a key focus. Their perspective: "I'm my own advocate."

Increasing Levels of Activation

- E Engagement
- A Adoption/Ability
- **D** Desired Results

SPREAD AND SUSTAINABILITY

SUPPORT

Effective and supportive leadership is critical in change. Leaders need to be visible, encouraging, and authentic. Leaders solicit and respond to feedback, demonstrating care and active listening.

Themes

- Visible and Visionary Leadership
- Encouragement and Support
- Feedback and Ideas
- Communication

POSITIVE CULTURE

Culture reflects the attributes, beliefs, perceptions & values employees share. Change leaders must understand the role that culture plays on staff behaviour and their ability to deliver improvements.

Themes

- Model the Way
- Rewarding Patient Care
- Common Vision and Practices
- Learning Culture

RESOURCES

Teams and individuals must feel capable to transition into the new desired state. Change leaders need to be able to provide time and access to knowledge (both intellectual and psychological) needed for staff to implement the required skills and behaviours.

Themes

- Capacity
- Investment

- Training and Education
- Accessibility

This is a high level summary of the Spread and Sustainability Resource Cards. Access a digital copy of the full resource cards here

ENGAGEMENT

The degree of person-centeredness in a system is reflected in superior decision making, design and care. Large-scale engagement is the best way to guarantee spread and sustainability in change. Change leaders need to roles, and feels that they have a voice in the change process.

Valued Contribution • Understanding Motivation Involvement

Ownership

ADOPTION

Understanding why errors occur and tackling poor design and procedures is key to improvement. Hearing, listening and responding to the voices of staff and patients is key to ensuring the successful implementation of a change. Change leaders need to ensure that reasons for change, processes, and required skills are made clear to maximize adoption.

Themes

• Keep it simple

• Reason for Change

• PDSA Cycles

Contextual Implementation

DESIRED RESULTS

All improvement will require change, but not all change will result in improvement.

Evaluation is vital to our understanding of which methods and innovations work to improve quality. Where there is a clear benefit from a change, innovation or improvement, that modification will be adapted and spread more rapidly.

Themes

• Impact measurement

Data Collection

Monitoring Improvement Outcomes
Innovation

APPENDIX A

Postoperative Patient Outcomes Definitions

Deep Incisional SSI Organ/Space SSI	Deep Incisional SSI is an infection which involves deep soft tissues. Deep soft tissues are typically any tissue beneath skin and immediate subcutaneous fat, for example fascial and muscle layers
Organ/Space SSI	
	Organ/Space SSI is an infection that involves any part of the anatomy (e.g., organs or spaces), other than the incision, which was opened or manipulated during an operation.
Wound disruption	The spontaneous reopening of a previously surgically closed wound.
Pneumonia	Pneumonia is an infection of one or both lungs caused by bacteria, viruses, fungi, or aspiration. Pneumonia can be community acquired or acquired in a healthcare setting.
Intraoperative OR Postoperative Unplanned Intubation	The placement of an endotracheal tube or other similar breathing tube [Laryngeal Mask Airway [LMA], nasotracheal tube, etc.] and ventilator support.
On Ventilator > 48 Hours	Total cumulative time of ventilator-assisted respirations exceeding 48 hours.
Pulmonary Embolism	Lodging of a blood clot in the pulmonary artery with subsequent obstruction of blood supply to the lung parenchyma. The blood clots usually originate from the deep leg veins or the pelvic venous system.
Progressive Renal Insufficiency/Acute Renal Failure Requiring Dialysis	Progressive Renal Insufficiency: the reduced capacity of the kidney(s) to perform its function in comparison to the preoperative state. Acute Renal Failure Requiring Dialysis: A clinical condition associated with significant decline of kidney function in comparison to the preoperative state.
Urinary Tract Infection	An infection in the urinary tract (kidneys, ureters, bladder, and urethra).
Stroke/Cerebral Vascular Accident (CVA)	An interruption or severe reduction of blood supply to the brain resulting in severe dysfunction.
Intraoperative or Postoperative Cardiac Arrest Requiring CPR	The absence of cardiac rhythm or presence of a chaotic cardiac rhythm requiring the initiation of cardiopulmonary resuscitation.
Intraoperative or Postoperative Myocardial Infarction	Blockage of blood flow to the heart causing damage or death to part of the heart muscle.
Transfusion Intra/Postop (RBC within the First 72 Hrs of Surgery Start Time)	Transfusion of red blood cells, whole blood, autologous blood, and cell-saver products.
Vein Thrombosis Requiring Therapy	New diagnosis of blood clot or thrombus within the venous system (superficial or deep) which may be coupled with inflammation and requires treatment.
Sepsis	Sepsis takes a variety of forms and spans from relatively mild physiologic abnormalities to septic shock Sepsis: systemic response to infection. Septic Shock: Sepsis is considered severe when it is associated with organ and/or circulatory dysfunction.
Still in Hospital > 30 Days	The patient remains in the acute care setting at your institution continuously for > 30 days after the principal operative procedure.
Postoperative Death > 30 Days of Procedure if in Acute Care	Death occurring > 30 days after the principal operative procedure, as a direct result of the surgery and/or associated with postoperative complications and the patient has remained in the hospital in the acute care setting at your site.
Hospital Readmission	Patients who were discharged from their acute hospital stay for their principal operative procedure, and subsequently readmitted as an inpatient to an acute care hospital setting.
Unplanned reoperation	A return to the OR that was not planned at the time of the principal operative procedure.
Average Acute LOS	Report at baseline, September 2019 to May 2021
Average Complication rate	Report at baseline, September 2019 to May 2021
Average Readmission rate	Report at baseline, September 2019 to May 2021

PATIENT ACTIVATION MEASURE® (PAM®)

Increasing Activation Starts with Measurement

The Patient Activation Measure® (PAM®) is a 10- or 13-item survey that assesses a person's underlying knowledge, skills and confidence integral to managing his or her own health and healthcare.

PAM segments individuals into one of four activation levels along an empirically derived 100-point scale. Each level provides insight into an extensive array of health-related characteristics, including attitudes, motivators, and behaviors. Individuals in the lowest activation level do not yet understand the importance of their role in managing their own health, and have significant knowledge gaps and limited self-management skills. Individuals in the highest activation level are proactive with their health, have developed strong selfmanagement skills, and are resilient in times of stress or change.

Disengaged and overwhelmed Individuals are passive and lack confidence. Knowledge is low, goal-orientation is weak, and adherence is

poor. Their perspective:

"My doctor is in charge

of my health."

Level 2

still struggling
Individuals have some
knowledge, but large
gaps remain. They
believe health is largely
out of their control, but
can set simple goals.
Their perspective: "1
could be doing more."

Becoming aware, but

🔒 Level 3

Taking action

Individuals have the key facts and are building self-management skills. They strive for best practice behaviors, and are goal-oriented. Their perspective: "I'm part of my health care team."

Level 4

Maintaining behaviors and pushing further

Individuals have adopted new behaviors, but may struggle in times of stress or change. Maintaining a healthy lifestyle is a key focus. Their perspective: "I'm my own advocate."

Increasing Levels of Activation

©2020 Insignia Health. Patient Activation Measure® (PAM®) Survey Levels. All rights reserved.

PAM is Backed by Extensive Research

The Patient Activation Measure survey is a unidimensional, interval level, Guttman-style question scale developed by Dr. Judith Hibbard, Dr. Bill Mahoney and colleagues at the University of Oregon. PAM was created and tested using Rasch analysis and classical test theory psychometric methods. Related versions include Caregiver PAM and Parent PAM, and over 35 validated translations.

To date, over 500 peer-reviewed published studies worldwide have documented the PAM survey's ability to measure activation and predict a broad range of health-related behaviors and outcomes. This foundation in research consistently demonstrates that individual self-management improves significantly as activation increases, and has led to endorsement of PAM as a performance measure by the National Quality Forum.

Rev.20200505

PATIENT ACTIVATION MEASURE®

PAM® Applications

The Patient Activation Measure survey is reliable and valid for use with all patients, including those managing chronic conditions and engaged in disease prevention efforts. PAM is widely used today in population health management programs, disease and case management systems, wellness programs, medical home projects, care transitions, value-based programs, and much more. PAM is applied in three key manners:

Patient Activation Measure® (PAM®) Application

- Improving segmentation and risk identification. Traditional risk models rely upon past utilization and
 have been shown to miss over half of the individuals in the lower two activation levels. Research
 consistently shows that lower activation is an indicator for disease progression, like <u>diabetes</u> or <u>depression</u>,
 as well as increased ED visits, hospital admissions, and <u>ambulatory care sensitive (ACS)</u> utilization.
- 2. Tailoring Support to PAM Level. Hundreds of health-related characteristics have been mapped to PAM Levels, offering a wealth of insight into a person's self-management abilities. This insight guides patient support to establish goals and action steps that are realistic and achievable for each individual. An activation-based approach to coaching and education, whether provided by phone, in clinic, online or inhome, has been proven to deliver significantly improved outcomes. Insignia Health's coaching model (Coaching for Activation*) and consumer-facing Web-based program (Flourish*) make over a decade of activation research and experience actionable for health care organizations and the people they serve.
- Measuring Impact. Even a single point change in PAM score is meaningful. By periodically readministering the PAM survey, the impact of patient support strategies and programs can be understood well in advance of traditional outcome measures.

About Insignia Health

Insignia Health specializes in helping health systems, health plans, hospitals, care management services, and other organizations assess patient activation and develop strategies for helping individuals become more successful managers of their health and health care. Insignia Health applies its proprietary family of health activation assessments to measure each individual's self-management competencies. The Patient Activation Measure® and over 15 years of health activation research form the cornerstone of a complementary suite of solutions that help clinicians, coaches and oppulation health providers improve health outcomes and lower costs. Insignia Health supports health activation efforts of over 250 health systems and organizations around the world.

InsigniaHealth.com

APPENDIX D

Diary of Symptoms

Diary of Symptoms

You can complete this form online and then print the form for easy reference. Only text that is visible on the form is printed; scrolled text will not print. Any text you enter into these fields will be cleared when you close the form; you cannot save it.

You can help your doctor diagnose and treat your condition by being prepared to answer questions about your symptoms. Since some symptoms are difficult to describe, it is helpful to write down information about your symptoms as you experience them during your daily activities.

While waiting for your appointment, keep a diary of your symptoms. This form may help. Describe the symptom for which you are keeping this diary:

Day	1	2	3	4	5	6	7
Time of day the symptom starts							
Time of day the symptom bothers you the most							
Does the symptom come and go during the day?							
Is the symptom affected by any of the following: Activity Rest Stress Recent changes in your eating patterns, such as skipping meals. Prescription or over-the-counter medicines (name of medicine and time of day it affects your symptom) Medicine name:	Time:						
Medicine name:							
Alcohol or caffeinated drinks (number and time) Number of drinks: Time of day: Smoking or the use of other tobacco products							
What other symptoms do you have:							
Rate how you felt today: 1 - Great 2 - Okay 3 - Not good 4 - Bad Other information about your symptoms:							

© 1995-2018 Healthwise, Incorporated. Healthwise, Healthwise for every health decision, and the Healthwise logo are trademarks of Healthwise, Incorporated.

The SHARE Approach: A Model for Shared Decision Making

The SHARE Approach is a five-step process for shared decision making that includes exploring and comparing the benefits, harms, and risks of each option through meaningful dialogue about what matters most to the patient.

Seek your patient's participation.

elp your patient explore & compare treatment options.

Assess your patient's values and preferences.

Reach a decision with your patient.

Evaluate your patient's decision.

Shared decision making occurs when a health care provider and a patient work together to make a health care decision that is best for the patient. The optimal decision takes into account evidence-based information about available options, the provider's knowledge and experience, and the patient's values and preferences.

Both health care professionals and patients benefit from using shared decision making.

Benefits to Health care Professionals:

- · Improved quality of care delivered
- Increased patient satisfaction

Benefits to Patients:

- Improved patient experience of care
- Improved patient adherence to treatment recommendations

Using the SHARE Approach builds a trusting and lasting relationship between health care professionals and patients.

The Agency for Healthcare Research and Quality (AHRQ) provides a collection of tools and training resources to support the implementation of shared decision making in practice. Refer to the AHRQ Shared Decision Making Toolkit Website to locate resources such as:

SHARE Approach Workshop Curriculum:

Collection of training guides, slides, videos, and other resources to support the training of health care professionals on shared decision making and SHARE Approach implementation

SHARE Approach Tools:

Collection of reference guides, posters, and other resources designed to support AHRQ's SHARE Approach implementation

SHARE Approach Webinars:

Accredited webinars that review topics related to the implementation of patientcentered outcomes research in shared decision making

SHARE Approach Success Stories:

AHRQ's SHARE Approach tools and resources are used by organizations nationwide to implement shared decision making in health care. These case studies highlight stories of successes and best practices by describing the use and impact of the AHRQ's SHARE Approach strategies and tools by health systems, clinicians, academicians, and other professionals.

These resources provide health care professionals with the training and tools they need to implement the SHARE Approach in their practice.

My Personal Action Plan

No matter what your health goal is, creating a specific plan can help you succeed.

Follow the steps to put you on a path toward meeting your goal.

You can fill out this form online, but the information can't be saved. Or you can simply print it and then fill it out by hand.

Step 1

Know your own reason.

Why is this change important to you? Make sure it's something that you really want to do.

Step 2

Set a specific long-term goal.

What is a long-term goal that you can reach in about 6 to 12 months?

Step 3

Set your short-term goals.

How can you create short-term goals that you take week by week to reach your long-term qoal?

Step 4

Prepare for slip-ups or setbacks.

What might get in the way of reaching this goal? You may already know that things like time, money, or emotions could get in the way. How might you get around these things?

Plan for support and rewards.

Who can help you meet your goals? Maybe friends, family, or a support group? And how will you reward yourself? A movie, a special meal, an hour to yourself can be a treat.

See your success.

How will your life be different after you make this change?

© 1995-2020 Healthwise, Incorporated. Healthwise, Healthwise for every health decision, and the Healthwise logo are trademarks of Healthwise, Incorporated.

This information does not replace the advice of a doctor. Healthwise, Incorporated, disclaims any warranty or liability for your use of this information.

Every time you talk with a health care provider ASK THESE 3 QUESTIONS

What is my main problem?

When to ask questions

You can ask questions when:

- You see a doctor, nurse, pharmacist, or other health care provider.
- You prepare for a medical test or procedure.
- You get your medication.

2

What do I need to do?

What if I ask and still don't understand?

- Let your health care provider know if you still don't understand what you need.
- You might say, "This is new to me. Will you please explain that to me one more time?"
- Don't feel rushed or embarrassed if you don't understand something. Ask your health care provider again.

Why is it important for me to do this?

Who needs to ask 3?

Everyone wants help with health information. You are not alone if you find information about your health or care confusing at times. Asking questions helps you understand how to stay well or to get better.

To learn more, visit ihi.org/AskMe3

Ask Me 3 is a registered trademark licensed to the Institute for Healthcare Improvement. IHI makes Ask Me 3 materials available for distribution. Use of Ask Me 3 materials does not mean that the distributing organization is affiliated with or endorsed by IHI.

Write your health care provider's answers to the 3 questions here:

1. What i	is my mai	in problem?
-----------	-----------	-------------

2. What do I need to do?

3. Why is it important for me to do this?

Asking these questions can help you:

- Take care of your health
- Prepare for medical tests
- ☑ Take your medications the right way

You don't need to feel rushed or embarrassed if you don't understand something. You can ask your health care provider again.

When you Ask 3, you are prepared. You know what to do for your health.

Your providers want to answer 3

Are you nervous to ask your provider questions? Don't be. You may be surprised to learn that your medical team wants you to let them know that you need help or more information.

Like all of us, health care providers have busy schedules. Yet they want you to know:

- All you can about your health or condition.
- Why their instructions are important for your health.
- Steps to take to keep you healthy and any conditions under control.

Bring your medications with you the next time you visit a health care provider. Or, write the names of the medications you take on the lines below.

Like many people, you may see more than one health care provider. It is important that they all know about all of the medications you are taking so that you can stay healthy.

Ask Me 3° is an educational program provided by the Institute for Healthcare Improvement / National Patient Safety Foundation to encourage open communication between patients and health care providers.
